

LASER SAFETY CABINETS

We supply both standard and bespoke Laser Safety Cabinets suitable for use in industrial, production and research environments. Our modular design allows flexibility and cost effective customisation.

Our standard cabinets have been designed to fit both laboratory optics tables and workshop benches. The cabinets are of an all metal construction and finished with a durable powder coating. Roller doors are used to remove the problem of hinged doors on existing working areas.

Standard cabinets feature one roller shutter door at the front and a single cable entry point to the side. Bespoke options include additional doors, internal lighting, warning lights, safety signs and viewing cameras. Cameras enable the user to monitor the inside of the cabinet during laser operation.

In order to comply with laser safety regulations, laser systems must be safety interlocked. Our cabinets can be supplied complete with our INTELLILOCK system or mounting points can be included to allow the user to install their own system.
